

Firebase Authentication Workshop

Developer Student Club
San Jose State University

Welcome

Agenda:

- Learning about Firebase
- Overview of some of the firebase products
- Firebase Authentication (Why? And What all can we do with it?)
- Get to the hands-on activity

What is Firebase?

- Backend by Google
 - Firebase is built on Google infrastructure and scales automatically, for even the largest apps.
- Builds apps fast and without managing infrastructure
 - Firebase gives you functionality like analytics, databases, messaging and crash reporting so you can move quickly and focus on your users.
- One platform, with products that works together
 - Firebase products work great individually but share data and insights, so they work even better together.

Upcoming Firebase Summit (27- 28 Oct, 2020):

<https://firebase.google.com/summit>

Why Firebase?

- No need to manage servers
- Gives time and energy to focus on fantastic user experience
- No need to write apis
- Provides analytics and dashboard
- Built in security(Not bolted on)
- Highly Scalable with no performance loss
- No downtime (I have been using it for past 3 years and I have not experienced downtime.)
- Easy to collaborate with team.

Firebase Products

- Firebase Authentication
 - Sign in with multiple platforms. It provides an end-to-end identity solution, supporting email and password accounts, phone auth, and Google, Twitter, Facebook, and GitHub login, and more.
 - Firebase auth integrates well with Firebase database to control access to data.(Authorisation)
- Firebase Realtime Database
 - The Firebase Realtime Database is a cloud-hosted NoSQL database that lets you store and sync data between your users in realtime.
 - Strong user-based Security

Firebase Products...

- [Firebase Hosting](#)
 - With Firebase Hosting, you can deploy a single-page web app, a mobile app landing page, or a progressive web app without all the hassle.
 - Free SSL Certificates for each site deployed.
- App monitoring and improvement tools
 - [Firebase Crashlytics](#) helps you track, prioritize, and fix stability issues that erode app quality, in realtime. Saves time in triaging and troubleshooting crashes.
 - [Firebase Performance Monitoring](#) helps keep your app fast and responsive.
 - [Firebase Test Lab](#)

Firebase Authentication

- Secure Authentication
- Easy and Fast implementation
- Multi-platform sign in

Sign-in providers	
Provider	Status
 Email/Password	Disabled
 Phone	Disabled
 Google	Enabled
 Play Games	Disabled
 Game Center	Disabled
 Facebook	Disabled
 Twitter	Disabled
 GitHub	Disabled
 Yahoo	Disabled
 Microsoft	Disabled
 Apple	Disabled
 Anonymous	Disabled

Firebase Authentication...

Authorized domains ⓘ

Add domain

Authorized domain	Type
localhost	Default
workshop-test-19.firebaseio.com	Default
workshop-test-19.web.app	Default

Firebase Authentication...

Templates

Email ?

- Email address verification
- Password reset
- Email address change
- SMTP settings

SMS

- SMS verification

Template language
English

Email address verification

When a user signs up using an email address and password, you can send them a confirmation email to verify their registered email address. [Learn more](#)

Verify your email for project-1046438632861

Message

Hello %DISPLAY_NAME%,

Follow this link to verify your email address.

https://workshop-test-19.firebaseio.com/_/auth/action?mode=<action>&obCode=<code>

If you didn't ask to verify this address, you can ignore this email.

Thanks,

Your project-1046438632861 team

Hands-on Activity

What are we trying to achieve using Authentication?

- Public pages - Accessible all the time
 - E.g. Home/ About us/ General info pages
- **Protected or Private pages - Accessible only after authentication**
 - E.g. Profile/ Settings/ Messages/ Personalised feeds
- Authentication pages - Accessible when not authenticated
 - E.g. Signin/ Signup

What do we need to get started?

- Node.js (<https://nodejs.org/>)
 - `node -v`
 - `npm -v`

To Create new React app...

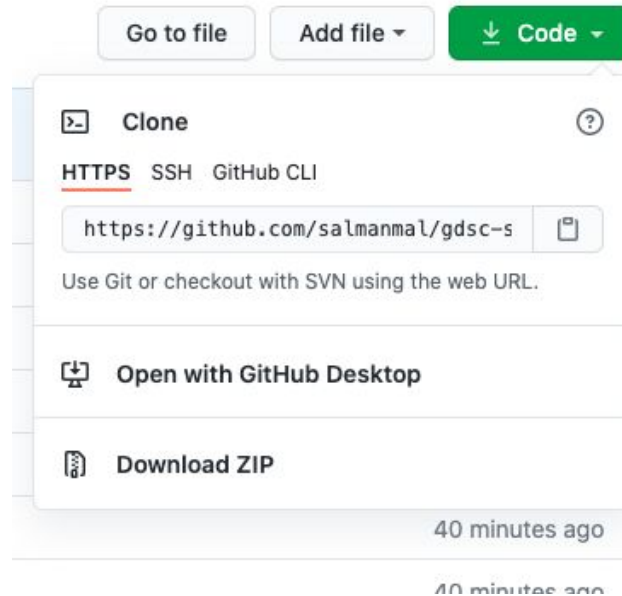

- `npx create-react-app app-name`
- Navigate to directory
 - `cd app-name`
- Run App
 - `npm start`

Clone from git repo

- git clone <https://github.com/salmanmal/gdsc-sjsu-firebase-workshop-react.git>
- Download zip from <https://github.com/salmanmal/gdsc-sjsu-firebase-workshop-react>

- Open terminal
- Navigate to app directory
- Install dependencies
 - npm install
- Start application
 - npm start

App framework and dependencies

- **React**
 - A javascript library for building user interface
 - Component-based
 - Single Page Application (SPA)
- **package.json**
 - Version and dependency management
- **react-router-dom** to display different pages depending on the current url
- **redux** a centralised state container for JS apps
- **react-redux** binding between react and redux

Firebase Dependencies

- `npm install firebase`

Firebase Project...

- Go to <https://firebase.google.com/> (Login with your google account)
- Click on GO to Console on top-right corner.
- Add Project (Give unique name and select next next)
- Open Project in console
- Set up Authentication options
- Project Setting-> General -> Add App to get firebase config

Authentication Documentation

- <https://firebase.google.com/docs/auth/web/google-signin>

Thank you
